1. INTRODUCTION

The purpose of this document is to provide guidance to users on the key issues relating to the schemas for reporting on the Floods Directive.

The reporting requirements for the Floods Directive can be found at the following address in the circa library:

<https://circabc.europa.eu/w/browse/91b38042-9cbd-4bff-b0dc-c406f967154e>

As reporting sheets are agreed upon they are translated into electronic reporting schemas. The purpose of this document is to provide guidance on the filling out of the schemas and issues to be aware of.

This user guidance document will eventually include information relating to all schemas developed to support Floods reporting. This version covers the reporting of administrative arrangements, the preliminary floods risk assessment, designate the areas of potential significant flood risk and the flood hazard and risk map.

1.1 What is in this document

- Section 2 provides an overview of the general issues in the schemas;
- Section 3.1 describes the Common Schema;
- Section 3.2 describes the key elements for reporting on Administrative Arrangements (Competent Authorities, Units of Management);
- Section 3.3 describes the key elements for reporting the Preliminary Flood Risk Assessment and the Areas of Potential Significant Flood Risk (PFRA and APSFR)
- Section 3.4 describes the key elements for reporting the flood hazard and risk maps (FHRM)

2. FD REPORTING SCHEMAS – GENERAL ISSUES

2.1 Background

The development of the Reporting schemas has followed the following accepted principles:

- *That Reporting sheets do not provide all the technical specifications needed to neither develop the data exchange formats nor provide guidance to the data provider.*
- *These technical specifications may lead, where necessary, to adaptations of reporting requirements in order to facilitate the electronic data exchange.*
- *The technical process will also ensure that data which has been already submitted to WISE do not have to be reported again.*
- *The technical specifications will be developed in cooperation with the Member States.*

The schemas were developed in conjunction with CIS Working Group F and its Drafting Group.

2.2 General issues

2.2.1 Stylesheets

Stylesheets, which convert the corresponding XML files to a more readable HTML format, are provided for each schema.

2.2.2 Namespaces, Schema and Stylesheet Locations

The schemas and stylesheets are located at URL:

<http://icm.eionet.europa.eu/schemas/dir200760ec>

<http://icm.eionet.europa.eu/schemas/dir200760ec/resources>

2.2.3 Metadata

As a minimum, the following metadata attributes are required for each XML file.

Attribute Name	Description	Status
CreationDate	Date the file was created	Required

Creator	Name of organisation	Required
Email	Contact email	Optional
Language	Reporting language	Required
Description	Descriptions of the file	Optional
GeneratedBy	Method used to generate the file e.g. Access tool	Optional

It is possible to provide a link to an associated metadata document for each file using the <METADATA> element which is provided at a number of locations throughout the schemas. This allows up to 2000 characters to be specified or alternatively may be used to provide a hyperlink or description of an associated metadata file. This should be used to define any restrictions on the data.

2.2.4 Additional Internet-based information

A <URL> element is also provided at a number of locations throughout the schemas. This allows a hyperlink to be provided to further information in the Member States own Internet-based systems. This could be, for example:

- A link to on-line relevant national methodology reports and statistics;
- A link to a feature/location in a web-based mapping system.

2.2.5 Required Elements

A large number of fields are **required** in order to ensure that the submission can be processed. Note that the term “mandatory” is no longer used in the context of schemas because of possible confusion with “mandatory” in the sense of legal compliance (i.e. failure to supply mandatory information is legally not in compliance with the directive).

In principle, information is required unless it is stated explicitly that information is optional or should be reported “if possible” or if “available”.

2.2.6 Conditional Elements

Other elements are **conditional**, for example <OtherCompetentAuthorities> which allows MS to define any other Competent Authority associated with the RBD/UoM and <InternationalName> which **must** be completed **only** if the answer is **YES** to the question in <International> “Is the RBD part of an international River Basin?” So the general rule is applied: If the answer to Element A is YES, then completion of Element B is required in Conditional Elements.

Conditional elements are not (technically) possible in XML schema. Therefore all these elements have been identified as optional in the schema but with the “Ifthen” conditional clause added to the annotation.

2.2.7 Optional Elements

Other elements are **optional**, for example those elements that allow MS to enter a URL or text strings for further information to aid clarity to an answer, or any information qualified in the Reporting sheets as due to be reported “if possible” or “if available”.

2.2.8 Common Elements

Each schema references a number of **common** elements. As with previous reporting, all common definitions and all enumeration lists are defined in the FDCommon schema. As part of the schema development some new common elements have been established.

3. THE SCHEMAS

The following sections provide the “annotations” or descriptive notes for the schema main elements which are intended to help and guide the person completing the schemas.

3.1 THE COMMON SCHEMA

This schema contains the elements common to all schemas including the enumeration lists.

Schema **FDCommon.xsd**

	enumeration	A	
	enumeration	B	
	enumeration	C	
annotation	documentation The various possible roles/responsibilities of a competent authority might be discharged at different levels in different Member States. Different competent authorities may also be responsible for different tasks in relation to point A below. This could result in a large number of competent authorities in some Member States. To circumvent any difficulties that this situation may cause, it is important that information on roles and responsibilities is clearly reported. For reporting purposes a competent authority will be defined as having one or both of the following core roles: A. Coordination, Preparation and Production of preliminary flood risk assessment, flood maps and flood risk management plans (FRMPs), including international coordination in transboundary Units of management; B. Reporting C.Other (Any other roles not covered under A or B)

	enumeration	A40	
annotation	documentation Define relevant characteristics of flooding. The list are in line with table A3 from list of flood types from February 2011 (version 6). One or more options can be selected. A31=Flash Flood: A flood that rises and falls quite rapidly with little or no advance warning, usually the result of intense rainfall over a relatively small area. A32=Snow Melt Flood: Flooding due to rapid snow melt, possibly in combination with rainfall or blockage due to ice jams. A33=Other rapid onset: A flood which develops quickly, other than a flash flood . A34=Medium onset flood: An onset of flooding, that occurs at a slower rate than a flash flood. A35=Slow onset flood: A flood which takes a longer time to develop.		

	A36=Debris Flow: A flood conveying a high degree of debris. A37=High Velocity Flow: A flood where the floodwaters are flowing at a high velocity. A38=Deep Flood: A flood where the floodwaters are of significant depth. A39=Other characteristics, or no special characteristics. A40=No data available on the characteristics of flooding.

annotation	documentation List of activities from Annex I, DIRECTIVE 2010/75/EC of 24 November 2010 (Date of publishing: 17.12.2010): 1. Energy industries 1.1. Combustion of fuels in installations with a total rated thermal input of 50 MW or more 1.2. Refining of mineral oil and gas 1.3. Production of coke 1.4. Gasification or liquefaction of: (a) coal; (b) other fuels in installations with a total rated thermal input of 20 MW or more. 2. Production and processing of metals 2.1. Metal ore (including sulphide ore) roasting or sintering 2.2. Production of pig iron or steel (primary or secondary fusion) including continuous casting, with a capacity exceeding 2,5 tonnes per hour

	2.3. Processing of ferrous metals: (a) operation of hot-rolling mills with a capacity exceeding 20 tonnes of crude steel per hour; (b) operation of smitheries with hammers the energy of which exceeds 50 kilojoule per hammer, where the calorific power used exceeds 20 MW; (c) application of protective fused metal coats with an input exceeding 2 tonnes of crude steel per hour. 2.4. Operation of ferrous metal foundries with a production capacity exceeding 20 tonnes per day 2.5. Processing of non-ferrous metals: (a) production of non-ferrous crude metals from ore, concentrates or secondary raw materials by metallurgical, chemical or electrolytic processes; (b) melting, including the alloyage, of non-ferrous metals, including recovered products and operation of non-ferrous metal foundries, with a melting capacity exceeding 4 tonnes per day for lead and cadmium or 20 tonnes per day for all other metals. 2.6. Surface treatment of metals or plastic materials using an electrolytic or chemical process where the volume of the treatment vats exceeds 30 m³ 3. Mineral industry 3.1. Production of cement, lime and magnesium oxide: (a) production of cement clinker in rotary kilns with a production capacity exceeding 500 tonnes per day or in other kilns with a production capacity exceeding 50 tonnes per day; (b) production of lime in kilns with a production capacity exceeding 50 tonnes per day; (c) production of magnesium oxide in kilns with a production capacity exceeding 50 tonnes per day. 3.2. Production of asbestos or the manufacture of asbestos-based products 3.3. Manufacture of glass including glass fibre with a melting capacity exceeding 20 tonnes per day 3.4. Melting mineral substances including the production of mineral fibres with a melting capacity exceeding 20 tonnes per day 3.5. Manufacture of ceramic products by firing, in particular roofing tiles, bricks, refractory bricks, tiles, stoneware or porcelain with a production capacity exceeding 75 tonnes per day and/or with a kiln capacity exceeding 4 m³ and with a setting density per kiln exceeding 300 kg/m³ 4. Chemical industry For the purpose of this section, production within the meaning of the categories of activities contained in this section means the production on an industrial scale by chemical or biological processing of substances or groups of substances listed in points 4.1 to 4.6 4.1. Production of organic chemicals, such as: (a) simple hydrocarbons (linear or cyclic, saturated or unsaturated, aliphatic or aromatic); (b) oxygen-containing hydrocarbons such as alcohols, aldehydes, ketones, carboxylic acids, esters and mixtures of esters, acetates, ethers, peroxides and epoxy resins; (c) sulphurous hydrocarbons; (d) nitrogenous hydrocarbons such as amines, amides, nitrous compounds, nitro compounds or nitrate compounds, nitriles, cyanates, isocyanates; (e) phosphorus-containing hydrocarbons; (f) halogenic hydrocarbons; (g) organometallic compounds; (h) plastic materials (polymers, synthetic fibres and cellulose-based fibres); (i) synthetic rubbers; (j) dyes and pigments; (k) surface-active agents and surfactants. 4.2. Production of inorganic chemicals, such as: (a) gases, such as ammonia, chlorine or hydrogen chloride, fluorine or hydrogen fluoride, carbon oxides, sulphur compounds, nitrogen oxides, hydrogen, sulphur dioxide, carbonyl chloride; (b) acids, such as chromic acid, hydrofluoric acid, phosphoric acid, nitric acid, hydrochloric acid, sulphuric acid, oleum, sulphurous acids; (c) bases, such as ammonium hydroxide, potassium hydroxide, sodium hydroxide; (d) salts, such as ammonium chloride, potassium chlorate, potassium carbonate, sodium carbonate, perborate, silver nitrate; (e) non-metals, metal oxides or other inorganic compounds such as calcium carbide, silicon, silicon carbide. 4.3. Production of phosphorous-, nitrogen- or potassium-based fertilisers (simple or compound fertilisers) 4.4. Production of plant protection products or of biocides 4.5. Production of pharmaceutical products including intermediates 4.6. Production of explosives 5. Waste management 5.1. Disposal or recovery of hazardous waste with a capacity exceeding 10 tonnes per day involving one or more of the following activities: (a) biological treatment; (b) physico-chemical treatment; (c) blending or mixing prior to submission to any of the other activities listed in points 5.1 and 5.2; (d) repackaging prior to submission to any of the other activities listed in points 5.1 and 5.2; (e) solvent reclamation/regeneration; (f) recycling/reclamation of inorganic materials other than metals or metal compounds; (g) regeneration of acids or bases; (h) recovery of components used for pollution abatement; (i) recovery of components from catalysts; (j) oil re-refining or other reuses of oil;
--	---

	(k) surface impoundment. 5.2. Disposal or recovery of waste in waste incineration plants or in waste co-incineration plants: (a) for non-hazardous waste with a capacity exceeding 3 tonnes per hour; (b) for hazardous waste with a capacity exceeding 10 tonnes per day. 5.3. (a) Disposal of non-hazardous waste with a capacity exceeding 50 tonnes per day involving one or more of the following activities, and excluding activities covered by Council Directive 91/271/EEC of 21 May 1991 concerning urban waste-water treatment (OJ L 135, 30.5.1991, p. 40.): (i) biological treatment; (ii) physico-chemical treatment; (iii) pre-treatment of waste for incineration or co-incineration; (iv) treatment of slags and ashes; (v) treatment in shredders of metal waste, including waste electrical and electronic equipment and end-of-life vehicles and their components. (b) Recovery, or a mix of recovery and disposal, of non-hazardous waste with a capacity exceeding 75 tonnes per day involving one or more of the following activities, and excluding activities covered by Directive 91/271/EEC: (i) biological treatment; (ii) pre-treatment of waste for incineration or co-incineration; (iii) treatment of slags and ashes; (iv) treatment in shredders of metal waste, including waste electrical and electronic equipment and end-of-life vehicles and their components. When the only waste treatment activity carried out is anaerobic digestion, the capacity threshold for this activity shall be 100 tonnes per day. 5.4. Landfills, as defined in Article 2(g) of Council Directive 1999/31/EC of 26 April 1999 on the landfill of waste (OJ L 182, 16.7.1999, p. 1.), receiving more than 10 tonnes of waste per day or with a total capacity exceeding 25 000 tonnes, excluding landfills of inert waste 5.5. Temporary storage of hazardous waste not covered under point 5.4 pending any of the activities listed in points 5.1, 5.2, 5.4 and 5.6 with a total capacity exceeding 50 tonnes, excluding temporary storage, pending collection, on the site where the waste is generated 5.6. Underground storage of hazardous waste with a total capacity exceeding 50 tonnes 6. Other activities 6.1. Production in industrial installations of: (a) pulp from timber or other fibrous materials; (b) paper or card board with a production capacity exceeding 20 tonnes per day; (c) one or more of the following wood-based panels: oriented strand board, particleboard or fibreboard with a production capacity exceeding 600 m³ per day. 6.2. Pre-treatment (operations such as washing, bleaching, mercerisation) or dyeing of textile fibres or textiles where the treatment capacity exceeds 10 tonnes per day 6.3. Tanning of hides and skins where the treatment capacity exceeds 12 tonnes of finished products per day 6.4. (a) Operating slaughterhouses with a carcass production capacity greater than 50 tonnes per day (b) Treatment and processing, other than exclusively packaging, of the following raw materials, whether previously processed or unprocessed, intended for the production of food or feed from: (i) only animal raw materials (other than exclusively milk) with a finished product production capacity greater than 75 tonnes per day; (ii) only vegetable raw materials with a finished product production capacity greater than 300 tonnes per day or 600 tonnes per day where the installation operates for a period of no more than 90 consecutive days in any year; (iii) animal and vegetable raw materials, both in combined and separate products, with a finished product production capacity in tonnes per day greater than: — 75 if A is equal to 10 or more; or, — $[300 - (22,5 \times A)]$ in any other case, where 'A' is the portion of animal material (in percent of weight) of the finished product production capacity. Packaging shall not be included in the final weight of the product. This subsection shall not apply where the raw material is milk only. (c) Treatment and processing of milk only, the quantity of milk received being greater than 200 tonnes per day (average value on an annual basis). 6.5. Disposal or recycling of animal carcasses or animal waste with a treatment capacity exceeding 10 tonnes per day 6.6. Intensive rearing of poultry or pigs: (a) with more than 40 000 places for poultry; (b) with more than 2 000 places for production pigs (over 30 kg), or (c) with more than 750 places for sows. 6.7. Surface treatment of substances, objects or products using organic solvents, in particular for dressing, printing, coating, degreasing, waterproofing, sizing, painting, cleaning or impregnating, with an organic solvent consumption capacity of more than 150 kg per hour or more than 200 tonnes per year 6.8. Production of carbon (hard-burnt coal) or electrographite by means of incineration or graphitisation 6.9. Capture of CO₂ streams from installations covered by this Directive for the purposes of geological storage pursuant to Directive 2009/31/EC 6.10. Preservation of wood and wood products with chemicals with a production capacity exceeding 75 m³ per day other than exclusively treating against sapstain 6.11. Independently operated treatment of waste water not covered by Directive 91/271/EEC and discharged by an installation covered by Chapter II

3.2 SCHEMA: ADMINISTRATIVE ARRANGEMENTS (COMPETENT AUTHORITIES AND UNITS OF MANAGEMENT)

Schema CA_UoM.xsd

This schema deals with the reporting requirements for competent authorities and units of management. **In principle it is expected that there will only be one file per Member State.**

Article 3.1 of the Floods Directive indicates that Member States may make use of the administrative arrangements made under Article 3 of the Water Framework Directive. The Water Framework Directive requires Member States to ensure the appropriate administrative arrangements, including the identification of the appropriate competent authority, for the application of the rules of the Directive within each river basin district lying within their territory. However, different competent authorities may be appointed by Member States for the Floods Directive. The Floods Directive also allows Member States to identify different units of management from the river basin districts used for the Water Framework Directive. Competent authorities will be required for each national river basin district or unit of management and for the portion of any international river basin district or unit of management lying within a Member State's territory.

In cases where different competent authorities have been appointed the Floods Directive requires Member States to communicate to the Commission by 26 May 2010 the information

referred to in Annex I of the Water Framework Directive. Any changes in administrative arrangements also need to be communicated within three months of the change coming into effect.

The Floods Directive (Article 3.2) allows Member States to identify units of management different from the river basin districts used for the Water Framework Directive. Units of management may be individual river basins and/or certain coastal areas, and may be entirely within national borders or may be part of an international unit of management or international river basin district. The Floods Directive requires Member States to communicate to the Commission information on the identification of units of management by 26 May 2010.

	Look Out! According to the Directive, this information should only be provided if different competent authorities have been appointed and/or different units of management identified from those already reported for the Water Framework Directive. However, if the same competent authority is used for the Floods Directive as for the WFD, but the relevant information in relation to the responsibilities for the Floods Directive was not yet notified to the Commission, such information should now be notified in accordance with this reporting sheet.
	Look Out! Data should only be provided if other units of management have been identified for the Floods Directive or if Water Framework Directive RBDs are being used but information was missing from a Member State's submission to WISE or if any of the information has changed.

element CA_UoM

3.2.1 Competent Authority

element CA_UoM/CompetentAuthority

A competent authority may be associated with many RBDs or other units of management, and may have different address and contact details for each association. A general/main address and specific addresses for RBDs and other units of management should be provided if appropriate.

element CA_UoM/CompetentAuthority/LegalStatus

diagram	 LegalStatus type fd:String5000Type Summary text of the legal status of each competent authority should be provided. This should include a summary of: - oThe legislation establishing the competent authority; - oThe legislation laying down the duties of the competent authority in relation to the Floods Directive; and - oThe legislation laying down other duties of the competent authority relevant (but not directly related) to the Floods Directive.

Core responsibilities should be reported in terms of (more than one may apply to a competent authority):

A. Coordination, Preparation and Production and implementation of the different stages of the Floods Directive, including:

- Identification of RBDs/UoMs;
- The Preliminary Flood Risk Assessment, including the identification of areas of potential significant flood risk;
- Preparation of flood hazard and flood risk maps;
- Coordination with competent authorities appointed for the Water Framework Directive;

- Establishment of Flood Risk Management Plans in accordance with article 7 and the Annex;
- Coordination of plans and measures included therein, and coordination with authorities responsible for such measures, at relevant level (e.g. RBD/UoM), including international coordination in transboundary basins;
- Monitoring and evaluation of progress of the implementation of measures in FRMP;
- Public consultation; and,
- Other responsibilities to be defined.

B. Reporting

- Public information and consultation;
- Reporting to Commission; and,
- Other responsibilities to be defined.

C Other

- Any other roles not covered above

element **CA_UoM/CompetentAuthority/Roles/Role/Comment**

diagram	
annotation	documentation Provide the details of the selected role

3.2.2 Unit of Management

element CA_UoM/UnitOfManagement

For the element UOMName, if there is no specific name of the UoM in English then use the national language (UOMNameNL) but always using Latin characters.

In most cases there will be only one PrimeCompetentAuthority in a UoM, which has a coordination role and the main responsibility over "Coordination, Preparation and Production of preliminary flood risk assessment, flood maps and flood risk management plans (FRMPs),

including international coordination in transboundary Units of management". Other relevant competent authorities can be added as appropriate using the optional element provided. More than one entry in the element PrimeCompetentAuthority is allowed in cases in which it is not possible to define clearly a prime competent authority because the existence of more than one competent authority of the same administrative level, with the same or similar levels of competence over water, covering for instance different geographical areas within the UoM or different water categories, without a clear coordination role attributed to any of them. It is up to the Member State to judge how best to report the situation in each particular UoM using the flexibility provided in the schema.

element CA_UoM/UnitsOfManagement/NationalRelationships

diagram	 Summary text will be required on the institutional relationships established in order to ensure co-ordination where the competent authority acts as a co-ordinating body for other competent authorities, or when more than one competent authority is established. This should include a list showing the co-ordinating body and the relationship between the co-ordinating body and the authorities whose activities it is co-ordinating, and relationships with other bodies carrying out tasks linked to implementation of the plans including for example civil protection agencies and early warning systems.

3.3 SCHEMA: PRELIMINARY FLOOD RISK ASSESSMENT AND IDENTIFICATION OF AREAS OF POTENTIAL SIGNIFICANT FLOOD RISK

Schema PFRA.xsd and APSFR.xsd

These two schemas deal with the reporting requirements for the preliminary flood risk assessment and the identification of areas of potential significant flood risk. **In principle it is expected that there will be one file per UoM/RBD.**

Article 4 of the Floods Directive requires Member States to undertake a Preliminary Flood Risk Assessment (PFRA) for each river basin district, unit of management or the portion of an international river basin district or unit of management lying within their territory. The identification of areas potential significant flood risk (art. 5) will be based on **available or readily derivable** information including the requirements specified in the directive (art. 4).

Exchange of relevant information is required between the competent authorities of Member States sharing international RBDs or units of management (art 4.3) and identification of areas identified as being at potential significant flood risk shall be coordinated between the Member States concerned (art. 5.2).

The Commission will need to know how the assessment has been carried out (e.g. methodology, criteria applied) and what aspects and factors have been excluded in the PFRA and the reasons for their exclusion, in order to check the compliance with articles 4, 5 and 13.1(a). The Commission will also need to be notified, and be provided with the relevant information, when Member States apply article 13.1(b), that is to not carry out a PFRA, but proceed directly to the preparation of maps and plans. In particular in case of areas that are not designated as areas of potential significant flood risk (and therefore will be excluded from the further implementation of the Directive), the Commission will need to know if the various aspects and factors mentioned in article 4 were taken into account by the Member State, and if not, for what reason. At the core of the requirements of article 4 is to use information on past significant floods as the basis for identifying where floods may occur in the future. To avoid increasing the administrative costs in relation to reporting, but still gathering sufficient information to enable the Commission to check compliance with the preliminary flood risk assessment, basic information and geographic location, which either can be identified providing spatial data of the area or if no spatial data available a name of locality where past floods have occurred, should be provided. More detailed information should however be provided for floods that occur in the future during subsequent implementation cycles, and which will be considered as past floods for the review of those cycles.

	Look Out!
	It is recognised that not all of the data requested in this reporting sheet will be available for reporting for significant floods that have occurred prior to 22 December 2011. However, having recognised this, it is expected that the data set out will be collected, and hence reported, by Member States for significant flood events that occur after 22 December 2011.

It is also recognised that other approaches may be used for identifying Areas of Potential Significant Flood Risk (APSFR), such as predictive modelling. The reporting sheet gives a possibility to explain the different approaches and methodologies applied.

Article 5 requires that the PFRA shall be used as the basis for the identification of areas for which Member States conclude that potential significant flood risk (APSFR) exist or might be considered likely to occur in the future for each river basin district, unit of management or the portion of an international river basin district or unit of management lying within a Member State's territory. Coordination is required between MSs sharing PSFR areas within international RBDs or other international units of management.

The PFRA must be completed by 22 December 2011 and made available to the Commission by 22 March 2012. The PFRA will be used by Member States as the basis for identifying areas where potential significant flood risks might exist, or might be considered likely to occur. The Directive does not specify when the requirements of Art. 5 must be completed, however, the identification must be completed soon after 22 December 2011, and in sufficient time to allow Member States to prepare flood maps by 2013.

Member States may apply article 13.1 (transitional arrangements) in the 1st implementation cycle, and either report on a PFRA carried out before 22 December 2010 (Art. 13.1(a)) or proceed directly to mapping and establishment of flood risk management plans (Art. 13.1(b)). If article 13.1(a) is applied, the result will include the identification of APSFR, but the information provided for the basis of such assessment may differ. This will be taken into account in each reporting stage, and when detailed reporting formats are developed. It is recognised that if article 13.1(b) is applied, APSFR will not be identified, instead maps at the appropriate scale according to article 6 will be prepared, showing where significant flood risk exists in these areas. To ensure transparency for the Commission, as well as the public and other actors, this reporting sheet asks Member States to report which provision has been used in different parts of their territory, the option used will be made transparent in map format to be visualised together with the map of APSFR

	Look Out! Member States may designate relatively large areas of <u>potential</u> significant flood risk (APSFR), compared to the areas that actually might be flooded. Flood risk management (the subject of Article 7) usually requires consideration of much larger areas than the areas that may actually be flooded. The identification of floodable areas is not due under Article 4, but under Article 6 of the Directive, through the production of the flood hazard and flood risk maps for all areas of PSFR. Thus, MSs may for instance choose to designate an area of PSFR as "river basin X except for the sub-basins of the tributaries P, Q and R" (where P, Q and R are tributaries for which no significant adverse impacts are anticipated, as demonstrated through application of the PFRA as set out in Articles 4 and 5).

Article 4.2 (d) of the Floods Directive requires that the impacts of climate change and long-term developments on the occurrence of floods should be considered in the Preliminary Flood Risk Assessment, depending on the specific needs of the Member States. Early consideration of climate change and long-term developments will ensure that areas identified as being at significant flood risk, and hence where flood maps and flood management plans are focused, reflects future flood risk resulting from climate change or other long-term developments.

The Floods Directive (Article 4.2) also identifies a range of specific other issues that should be taken into account in undertaking the Preliminary Flood Risk Assessment. This does not preclude the use of any further other relevant available or readily derivable information by MSs.

3.4 SCHEMA: FLOOD HAZARD AND RISK MAPS¹

Schema FHRM.xsd

Article 6 of the Floods Directive requires member states to prepare flood hazard maps and flood risk maps. These maps must be prepared, at the river basin level and at the most appropriate scale, for the areas of potentially significant flood risk identified under Article 5 or according to article 13.1 (a), or for the areas for which MS decide to prepare flood maps according to article 13(1)(b) (art 6.1). Member States will determine the most appropriate scale of flood hazard maps and flood risk maps, and different scales can be chosen for instance depending on the location and type of map. The scale at which information is made available at European level via WISE is a different matter, and visualisation of flood related information in WISE (at scale 1:250.000) will be developed in separate GIS Guidance (CIS Guidance document n°22, new Annex 13). Member States may chose to develop several flood maps for each type of relevant flood, provided that the requirements of the Directive are complied with.

Flood hazard maps must show the geographical area which could be flooded under different scenarios (art. 6.3), whereas flood risk maps must show the potential adverse

¹ Text is from agreed FHRM Reporting sheet

consequences of these flood scenarios (article 6.5). The flood maps must be prepared for the following flooding scenarios:

- (a) floods with low probability, or extreme event scenarios;
- (b) floods with a medium probability (likely return period ≥ 100 years);
- (c) floods with a high probability, where appropriate.

Members States have flexibility to assign specific flood probabilities to these scenarios.

For each scenario, Members State must prepare information of flood extents and water depth or levels (art 6.4). Where appropriate, Members States could also prepare information on flow velocities or the relevant water flow..

For each flooding scenario, the flood risk maps shall show:

1. the indicative number of inhabitants potentially affected;
2. type of economic activity of the area potentially affected;
3. installations as referred to in Annex I to Council Directive 2008/1/EC (codified version of Directive 96/61/EC of 24 September 1996) concerning integrated pollution prevention and control which might cause accidental pollution in case of flooding and potentially affected WFD protected areas² identified in Annex IV(1)(i), (iii) and (v) to Directive 2000/60/EC;

The maps may show other information which the Member State considers useful such as the indication of areas where floods with a high content of transported sediments and debris floods can occur and information on other significant sources of pollution.

For coastal flooding where there is an adequate level of protection in place, and for groundwater flooding, Member States can decide to limit the preparation of flood hazard maps to low probability or extreme events (art 6.6 and 6.7).

The flood hazard maps and flood risk maps must be completed by the 22nd December 2013 and made available to the Commission by the 22nd March 2014. Member States may also use flood hazard maps and flood risk maps which were finalised before 22.12.2010, provided these maps "provide a level of information equivalent to the requirements of Article 6" (art 13.2).

Prior exchange of information between Member States in the preparation of Flood maps is required in shared Units of managements (art 6.2).

The preparation of flood hazard maps and flood risk maps shall be coordinated with the review of the assessment carried out under article 5 of the Water Framework Directive 2000/60/EC. The coordination shall ensure that the information they contain is consistent, and the overall purpose of the coordination is to focus on opportunities for improving efficiency, information exchange and achieving common synergies and benefits having regard to the environmental objectives of that Directive.

² The term "protected areas", referring here to areas identified in WFD Annex IV(1)(i), (iii) and (v), such as Natura 2000 areas, should not be confused with areas protected against floods, e.g. by dikes.

To enable the Commission to assess the compliance of Member States flood hazard maps and flood risk maps with the requirement of article 6 and 13.2, a number of summary questions are included in this reporting sheet focusing on the methodology for preparing flood hazard maps and flood risk maps.

Flood hazard maps and flood risk maps shall also be made available to the public by the Member States.

All reporting under the Directive should be done electronically via WISE (Water Information Systems for Europe). The reporting of Flood hazard maps and flood risk maps however presents two main challenges in this context.

Firstly, the current scale of visualisation of maps in the current WISE map viewer (scale 1:250000) might not be the appropriate scale for such maps, as mentioned in the Directive.

Secondly, the INSPIRE Directive rules for metadata on relevant topics will not be operational until after 2014, that is most likely after the reporting deadline for the flood hazard maps and flood risk maps.

This leads to a two pronged approach on reporting and visualisation of flood maps via WISE.

To address these challenges, a decentralised and staged approach to reporting flood maps will be implemented. The detailed and reference data for the flood hazard maps and flood risk maps shall rest in the national repositories for these maps (the decentralised approach), with web-links to these maps provided through geographical information as set out in section C of the reporting sheet (and through textual information on methodologies) provided to the public through WISE.

Under the staged approach, it is proposed that ***in the short term (until 2014)*** the reporting of flood maps should be based on textual information on methodologies used, and reporting of geographical information as set out in section C, with web-links to detailed maps held in the Member States. This should be visualised in a way which allows the user to select an area from the EU-wide WISE background map, and then via hyperlink established in WISE, to switch and to zoom into the correct area at MS level. This will also take into consideration the reporting of existing maps according to article 13.2. Data, as set out in section C, shall be reported which are required to enable certain maps and reference data sets to be produced at the European level (WISE scale) and to enable compliance checking by Commission, and, subject to prior consent of the Member State, for other uses by the Commission, including JRC and EEA.

In the longer term as INSPIRE is being implemented, notably to be in place for the second cycle of flood maps (deadline for establishing maps : 22.12.2019), the format for reporting/data and information exchange and visualisation/displayed of flood maps should be in a decentralised mode foreseen by that Directive, and in line with a Shared Environmental Information System (SEIS) initiative and made available via WISE.

	Look Out! Fully INSPIRE compliant reporting formats may not be operational for the 1 st cycle of reporting of flood hazard maps and flood risk maps.
---	---

	Member States have to implement the system to the reporting of the second cycle (March 2020) at the latest, although reporting should as far as reasonably possible be INSPIRE compliant in the first cycle. Depending on the developments under the implementation of INSPIRE, this reporting sheet or other related document may need to be revised. For the first cycle, Member States can report either in an INSPIRE compatible format (decentralised system), or if not fully implemented in that Member State, hyperlinks to maps available in digital format, with geo-referenced hyperlinks which enables access from a certain area identified within WISE. For the second cycle, reporting formats/schemas shall aim at being fully INSPIRE compliant.

For both stages the content of the reporting needs to be defined in this Reporting sheet, but the technical reporting schemas and formats may differ between the 1st and 2nd cycles. The reporting sheets developed for the first implementation cycle will be assessed after the reporting, and if necessary be subject to a revision. This may be particularly relevant for the reporting of flood hazard and flood risk maps.

CIS Guidance Document No. 22: Updated Guidance on Implementing the Geographical Information System (GIS) Elements of the EU Water policy, shall be taken into account, and relevant parts should also be updated for the purpose of reporting of the Floods Directive by WG F (supported by the drafting group).³ The further development of reporting/data exchange formats and visualisation shall furthermore be in line with relevant requirements of INSPIRE, in particular as regards the Annex III theme Natural Risk Zones, but also in relation to other relevant themes. Active involvement of WG F in the development of the INSPIRE requirements is foreseen.

Different existing data layers in WISE (e.g. RBD, sub-units, as well as currently under development 'WISE main rivers and Main lakes' reference dataset), and databases such as European Pollutant Release and Transfer Register (E-PRTR) can be used, along with background maps such as those provided for the PFRA (according to application of article 4,5 and 13.1 as relevant), showing topography and land-use.

As outlined in the Concept paper on reporting (chapter 3.2) information for other uses may be asked for, with the consent from the Member States; going beyond compliance checking purposes for the Floods Directive. With a view of streamlining reporting on, for instance, State of the Environment reports by the European Environment Agency with reporting for the Floods Directive, some additional optional information may be asked for.

³ http://circa.europa.eu/Members/irc/env/wfd/library?l=/framework_directive/guidance_documents&vm=detailed&sb=Title

To facilitate and structure the technical reporting formats, enumeration lists of types of floods and of types of adverse consequences will be developed, to be implemented in the reporting schemas. Appropriate structures such as NACE codes⁴, or national correlated equivalent codes, can for instance be used for this purpose.

	Look Out! Coordination at the scale for the RBD (or smaller Unit of management, if relevant) is important, such as for the identification of common scenarios, for instance in the view of assessing the impacts of climate change on floods (Ref. Guidance document "River Basin Management in a changing climate"), which may have an impact on flood maps. Thus, coordination between member states and between regions in such shared RBD / UoM in the production of flood hazard maps and flood risk maps will therefore be important.
---	---

It is also noted that certain information in relation to the implementation of this Directive, such as mapping of effects of failures of critical infrastructure, may need to be reported to the Commission for compliance checking purposes only, if such information be deemed classified in the Member State concerned.

4

NACE : The **Statistical Classification of Economic Activities in the European Community** (in French: Nomenclature statistique des activités économiques dans la Communauté européenne), commonly referred to as **NACE**, is a European industry standard [classification system](#) consisting of a 6 digit code.

FHRM/FloodHazardMaps/HazardArea/QuantitativeLikelihood/MediumProbability/MediumScenario/FloodRiskMap/ExposedElement/EconomicActivity/EconomicActivityConsequence

diagram	 The diagram shows the EconomicActivityConsequence element with a 'type' attribute and a cardinality of 1..∞. It is connected via a choice connector to two optional elements: TypeEconomicActivity (with a 'type' attribute of 'fd:TypeEconomic' and a note 'Indicate consequence from enumeration list') and OtherConsequenceDescription (with a 'type' attribute of 'fd:String250Type' and a note 'CONDITIONAL. Only to be used if the type is set to 'Other' in the enumeration list').
